Introduction

The Advanced Sales Analytics Dashboard is an Excel-based reporting tool designed to help users understand and analyse sales performance. It presents sales information in a structured format so users can review business performance and make better decisions.

This user manual explains how to use the dashboard in simple words.

2. Purpose of the Dashboard

The main purpose of the dashboard is to make sales reporting easier and faster.

Users can use a sales dashboard to:

- Understand overall sales performance.
- Compare sales across different periods.
- Identify products or regions with higher or lower sales.
- Review important sales figures in one place.
- Present sales information clearly to managers and team leaders.
- Support business decisions using sales data.

Note: The exact metrics and features depend on the contents of the Excel workbook.

3. How to Open the Report

1. Locate the Excel file named **Advanced Sales Analytics Dashboard.xlsx**.
2. Open the file using Microsoft Excel.
3. Enable editing if the file opens in Protected View and the file is trusted.
4. Review the available worksheets.

5. Open the dashboard or summary sheet to begin reviewing the report.

4. How to Use the Dashboard

Step 1: Review the Summary

Start by looking at the main dashboard. Review the available summary figures, charts, and tables to understand the overall sales performance.

Step 2: Check the Sales Figures

Read each displayed figure carefully. Depending on the workbook, these may include total sales, sales growth, order counts, or other performance indicators.

Step 3: Review the Charts

Charts help users understand sales patterns visually. Use them to compare categories, identify trends, and find areas that may need attention.

Step 4: Apply Filters

If the dashboard includes filters or slicers, select the required options to view a particular period, region, product, or other category supported by the report.

Step 5: Compare Results

Compare the figures shown for different categories or periods. Look for increases, decreases, and unusual changes that may require further investigation.

Step 6: Prepare the Report

After reviewing the results, summarise the important findings and share them with the relevant manager or team.

5. Understanding Sales Information

Sales figures help users understand how the business is performing.

- **Total Sales:** The total sales value recorded in the selected data.
- **Sales Trend:** How sales change over time.
- **Product Performance:** How individual products perform compared with others.
- **Regional Performance:** How sales differ between regions, if regional data is available.
- **Order Information:** Details about orders, if included in the report.
- **Performance Comparison:** Differences between categories or reporting periods.

These are common sales-reporting concepts. Only use the metrics that are actually available in the workbook.

Conclusion

The Advanced Sales Analytics Dashboard can help users organise sales information, review performance, identify trends, and prepare management reports. By following this manual, users can learn the basic process of opening the report, reviewing figures, applying available filters, updating data, and checking results.

For accurate workbook-specific instructions, the actual worksheet names, dashboard charts, formulas, and filters should be checked against the Excel file before this manual is used as the final operating guide.
